

Assignment 6 - Schools closer to hurricane paths in Florida

For this assignment, I focused on the private and public schools of Florida and tried to map their distances from hurricane paths registered since 1851. All data were downloaded from the Florida Geographic Data Library. Using the tools required for this assignment, I could generate some data about the amount of students enrolled and teachers that make part of those schools. Unfortunately, a relevant part of my data was not included on my attribute table, but once you have all the numbers, those analyses could be useful to foresee the amount of people affected in case of hurricanes.
